Pre-Submission Test Checklist

Xyndrome for iOS — version **1.0.0 (build 2)**, commit **d9089894** on branch v6.3. Every “expected” below was read from this build’s source, not assumed. Backend pulled on the server 14 Oct; Section 1 confirms it actually took effect.

> **Backend pulled — now confirm it took effect**
>
> The code carrying the three IAP fixes is on the server. **A pull alone does not restart the Node app**: until `tmp/restart.txt` is touched, the old process is still serving, and a reviewer buying the **1-year plan is still rejected by our own server** with a 400 after Apple has charged — a likely Guideline 2.1 rejection. Section 1 is now a two-minute verification, not a deployment. Do not upload until it passes.

1. Confirm the deploy landed — before uploading

The pull is done. Restart the app and verify what is actually running:

```
touch ~/public_html/tmp/restart.txt
```

- [ ] **App restarted** after the pull (the command above). Without this the old code is still serving.
- [ ] Frontend deployed via the cPanel **Deploy** button (admin product-ID field + IAP table).
- [ ] **Single proof both deploys landed:** Admin → Subscriptions now shows an **Apple in-app purchases** section, and the plan edit form has an **Apple product ID** field. Neither existed before today. If they are missing, something did not deploy — stop and fix that first.
- [ ] **Master Prep is still 365 days.** `SELECT name, duration_days, apple_product_id FROM plans WHERE slug = 'master-prep-6m';` — must read 365 and app.xyndrome.lk.yearly. If it reads 180, the old seeder reset it and yearly buyers get half the access they paid for.
- [ ] All four products mapped: `SELECT name, duration_days, apple_product_id FROM plans WHERE apple_product_id IS NOT NULL;` — exactly 4 rows at 7 / 30 / 90 / 365 days.
- [ ] Plan names applied on live (they do not propagate automatically any more): Quick Revision - 7 Days, Monthly Prep - 1 Month, Complete Prep - 3 Months, Master Prep - 1 Year.
- [ ] In App Store Connect: all four subscriptions **Ready to Submit**, in **one subscription group**, with the paid-apps agreement and tax/banking complete. A product missing here will not appear in the app.

2. What changed in this build — retest these first

Since the previous device build, four changes affect behaviour:

Change	What to retest
Billing refresh on redeem	Plan changes now update the subscription page (Section 4)
AVG MARKS dashboard chip	Replaces READINESS; floored average + coloured delta (Section 5)
Screenshot shield races	Protected screens still render and accept the pen (Section 7)
Yearly product mapping	Server-side; verify via Section 1, then buy it in Section 4

3. Apple review-critical — a reviewer will check these

All of these are present in this build; confirm each still works on the device.

- [ ] **Sign in with Apple** offered on the login screen (Guideline 4.8, required because Google sign-in exists).
- [ ] **Restore Purchases** visible on the paywall and working on a reinstall (3.1.1).
- [ ] **Account deletion in-app**, reachable without contacting support (5.1.1(v)).
- [ ] Paywall states **price, period and that it auto-renews until cancelled** (3.1.2).
- [ ] **Terms of Use** and **Privacy Policy** links on the paywall both open (3.1.2).
- [ ] **Manage or cancel** explains Settings → Apple ID → Subscriptions (3.1.2).

- [ ] **No external purchase path** anywhere in the iOS app — no web checkout link, no bank-transfer option, no mention of paying elsewhere (3.1.1). This is the most common rejection reason for this app type.
- [ ] No placeholder or “coming soon” UI anywhere (2.1).
- [ ] App works on a **fresh install, signed out**, with no prior data.

4. In-app purchase — the full flow

*Use a **Sandbox Apple ID** (Settings → App Store → Sandbox Account), not your real one.*

> **Sandbox compresses every duration**
>
> 1 week → 3 min · 1 month → 5 min · 3 months → 15 min · 1 year → **1 hour**. It auto-renews 6 times then stops. A “yearly” purchase lapsing within the hour is correct, not a bug — plan your test window around it.

- [ ] Paywall lists **all four plans with prices**.
- [ ] Buy **Complete Prep**: access unlocks **without restarting**, and Q-Bank content is immediately unlocked.
- [ ] **Change plan** to a higher tier: the subscription page shows the **NEW** plan. This was today’s bug — it used to keep showing the old package.
- [ ] Buy the **1-year plan**: no error, and the page shows Master Prep. This is the one that was rejected.
- [ ] **Restore Purchases** after a delete-and-reinstall returns access with no duplicate subscription.
- [ ] **Cancel mid-sheet**: no error banner, nothing recorded.
- [ ] Admin → Subscriptions → **Apple in-app purchases**: every purchase appears with a plan name, a Sandbox badge and a subscription number.

*Expected, **not** bugs: paywall names and prices come from App Store Connect via StoreKit, so renaming a plan in the admin panel does not change the iOS paywall. And a **downgrade is deferred by Apple to the next renewal**, so the plan correctly does not change immediately.*

*If a purchase fails, the admin IAP table says where: a row reading **“No plan mapped”** is ours to fix (map the product id); **no row at all** means it failed at Apple or in transit, before our server saw it.*

5. Dashboard and study flow

- [ ] Dashboard loads with no error and shows **AVG MARKS** (not READINESS).
- [ ] AVG MARKS equals your own results average, **floored** — 19.5 and 19.9 both show 19.
- [ ] The delta reads as a bare **+4%** in green or **-4%** in red; **No change** when it has not moved. With one exam it reads **1 exam**; with none, **No exams yet**.
- [ ] Courses → a course → a lesson opens and renders.
- [ ] AI Notes lesson opens, scrolls and zooms.
- [ ] Q-Bank: start a quiz, answer, submit, and the result appears in Results.
- [ ] Flashcards review runs and saves progress.
- [ ] Results list matches what the dashboard average is computed from.

6. Accounts and onboarding

- [ ] Email + password sign-up, including the **one-time email OTP** (needs SMTP on).
- [ ] The OTP code is **not** visible in any API response or on screen before the email arrives.
- [ ] Google sign-in works (skips OTP).
- [ ] Sign in with Apple works and creates a usable account.
- [ ] Forgot password sends a real email and the reset link works.
- [ ] Sign out, then sign back in, keeps your data.
- [ ] Delete account removes access and signs you out.

7. Screen behaviour and device checks

- [ ] Protected screens (lesson, quiz, flashcards) **render correctly and accept Apple Pencil input**. After switching away and back there is a pause of about 1.2 s before the pen responds — expected.
- [ ] Rotate the device on a lesson and a quiz: no clipped content, no overlap with the notch or home indicator.
- [ ] Dark mode and light mode both legible across dashboard, lesson and quiz.
- [ ] Background the app for a minute and return: no blank screen, no logout.
- [ ] Airplane mode: clear error messages, no crash, and recovery when the network returns.
- [ ] Test on the **smallest device you support** as well as the iPad.

8. Hidden in this release — confirm they are invisible

Five tools are switched off by launch flags. A reviewer must see no trace of them: no empty shelf, no greyed-out button, no “coming soon” label.

- [ ] **OSCE**, **ECG**, **Auscultation**, **Drug randomizer** and **My Notes** absent from the Study Hub, the iPad side rail and search.
- [ ] None of their screens is reachable (the routes are sealed, not just unlisted).

9. Known limitations — decide, do not discover

Screenshot blocking does not work yet

On iOS a screenshot still gets through on protected screens after repeated close/reopen. Four real races were fixed, but a capture was still observed, so at least one more mechanism is in play. **Not an App Store blocker** — iOS has no API to block the screenshot gesture, and nothing in the app claims otherwise. Android is unaffected (FLAG_SECURE is a real OS block). Ship it as is, knowing it is a deterrent rather than a guarantee.

Open before launch, unrelated to review

1. Git-tracked backup tarballs contain live DB / OpenRouter / VAPID / APNs credentials in a **public repository** — rotate them regardless of whether the files are ever removed from history. **2.** NODE_ENV is not set to production on the server, so a failed OTP send can still leak the code in the API response. Setting it also stops schema sync re-seeding plans on boot.

10. Sign-off

- [ ] Section 1 fully cleared (**the deploy is done**).
- [ ] Sections 3 and 4 passed on a real device with a Sandbox account.
- [ ] Screenshots and App Store metadata reflect only features visible in this build.
- [ ] Build 1.0.0 (2) uploaded, and this is the build selected for review.

Fastest path to a clean review

Deploy the backend, confirm Master Prep reads 365 days, then buy each of the four plans once on the device and switch between two of them. If all five of those succeed and the admin IAP table shows a plan name for every row, the part of this app most likely to fail review is working.
